## CS10 With-Computer Final (Fall 2018, Sec 1)

There are three questions, two Snap! ones and a Python one. Save your Snap! code into a Snap! file, and name it **FinalYourfirstnameYourlastname.xml** (e.g., **FinalAlanTuring.xml**). For the Python question, create a new Python file and name it **FinalYourfirstnameYourlastname.py** (e.g., **FinalAlanTuring.py**). Submit both files on bCourses under the "online" final assignment for your lab section. All questions are independent, and each worth 5.

## Snap! Questions: (use this starter file: <a href="https://bit.ly/2xFAABY">https://bit.ly/2xFAABY</a>)

Palindrome words are those which read the same backward as forward, e.g., **OTTO**, **I** and **ANA**. A better name for these would be *PalindromeALL* words, because ALL letters have to match backward as forward. We're interested in *PalindromeANY* words, in which ANY letters can match, e.g., **OTTO**, **I**, **ANA**, **CAL**, and **REAR**. You guessed it, **STANFORD** is not a *PalindromeANY* word, since no letters match.

- a) Write it *recursively*. You may not use any iteration (**repeat**, **repeat until**, **for**, **for each**) or higher-order functions in this solution.
- b) Write *without using recursion*. You can earn +3 bonus points if you can do it with only higherorder functions (i.e., only **map**, **keep** and **combine** to drive the iteration). Here are three helpers you might find handy (note the **map** shown below is in addition to the built-in **map**).

## **Python Question:**

Write a function that **find\_GC** that takes in two dictionaries (**GP** capturing grandparents  $\rightarrow$  parents, and **PC** capturing parents  $\rightarrow$  children) and *returns a new dictionary of all grandparents*  $\rightarrow$  children *it finds*. As an example, we have three grandparents: 1, 2 and 3; three parents: 10, 11 and 12; and two children: 100 and 200 with  $\rightarrow$  connections as shown below. Your function would return the two grandparents  $\rightarrow$  children: 1 $\rightarrow$ 100 and 2 $\rightarrow$ 100. By the way, more than 2 grandparents can  $\rightarrow$  to the same parent; similarly for parents  $\rightarrow$  children (sometimes family records get corrupted, it's not our job to worry about that).

```
Grand-
parents Parents Children

1 10 100

2 11 200

3 12 200

Dictionary GP Dictionary PC
```

```
>>> GP = {1:10, 2:10, 3:11}
>>> PC = {10:100, 12:200}
>>> find_GC(GP,PC)
{1: 100, 2: 100}
```

If you forget any commands, remember there's **help**(*type*) and **dir**(*type*), as in **help**(**dict**) or **dir**(**str**).
