

# **Programming**

or

## What's Happening to My Brain?

# How to Read a Program

Can always be read sequentially; each block starts when the previous one finishes\*.

*One exception:* if several things are happening in parallel.

\* BYOB provides a couple of blocks that this may not seem true for, such as `broadcast` and `play sound`. You should still think of these as sequential operations that can take care of most of their work while the remainder of your code runs.

# Programming: General Tips

I'd recommend that you think about abstract “algorithms” before code. ***Think about how you solve the problem in your head.***

Drawing and writing on paper is *not* out of style.

This class (and programming in general) is rarely about getting THE right answer. There are often many correct solutions.

# Our Toolbox (so far!)

## 1) Default Blocks

## 2) Variables

chosen word

index

sides

bigger number

## 3) Conditionals

## 4) Loops

## 5) Your blocks

get largest number in

to the power of

## 6) Lists

# 1 Default Blocks

There are three types of blocks in BYOB:

***COMMANDS***

***REPORTERS***

***PREDICATES***

The best way to learn about the available blocks is to play around with them.

# 2 Variables

## **Variable Scope**

*Global* – can be read and written by any script.

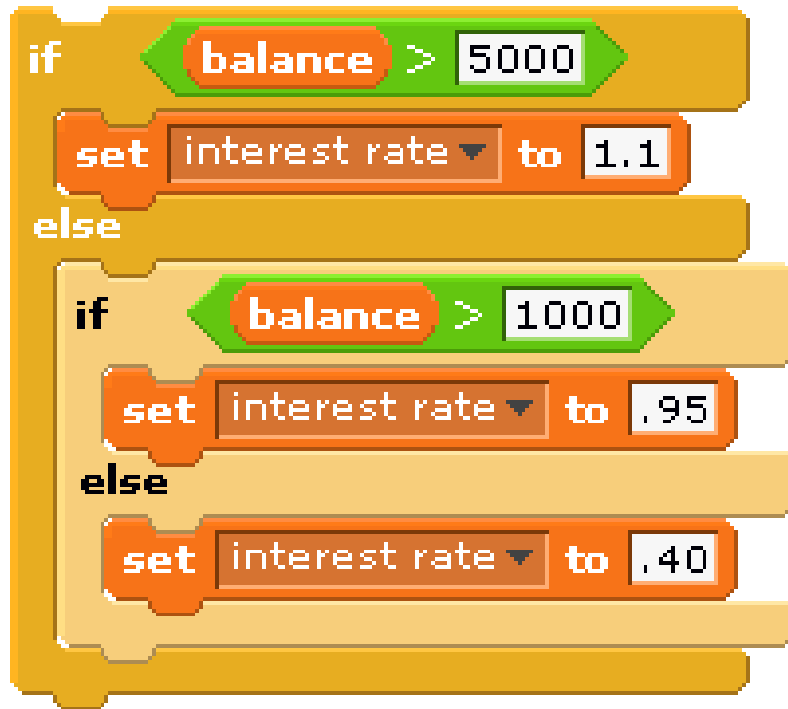

*Local (“script”)* – can only be read and written by the current script / block

# 2 Variables: Example

Let's say you're building an adventure game like Zelda. **What are some variables that you might create?**

What if you're building Connect 4 or chess?

# 3 Conditionals

*Conditionals* allow our program to do different things depending on what state it's in.

***IF***

***IF / ELSE***

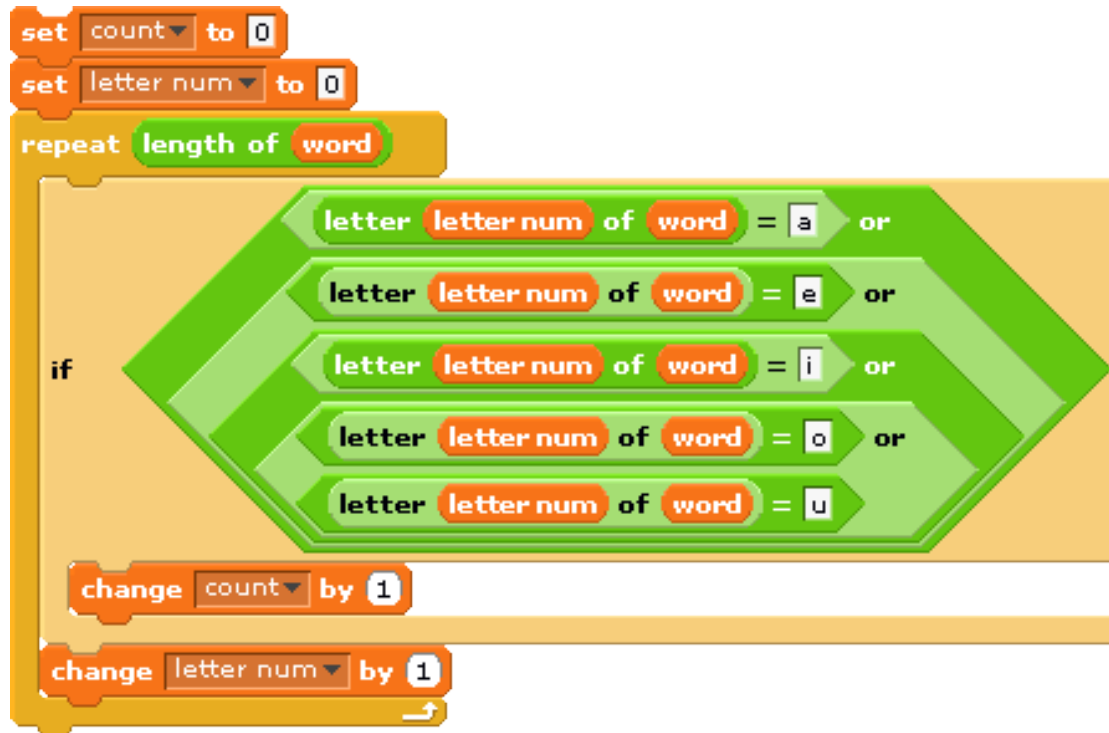

# MIDPOINT CHALLENGE

Write some code that can validate whether a password is secure (in this case: at least 8 characters long, includes letters and #'s).

Note that you will also need a loop for this problem.

# 4 Loops

Loops let us repeat code a varying number of times. They also lead to more compact code.

***REPEAT***

***REPEAT UNTIL***

***FOREVER***

# 4 Loops: Example

How would you write the following block?

to the power of

(don't worry about negative exponents)

# 5 Custom Blocks

get largest number in 

 to the power of 

Blocks take a certain number of *parameters* (inputs) and produce either zero or one output.

***WHY BUILD BLOCKS?***

# 5 Custom Blocks: Example

How would you build the following block?

# 6 Lists

Lists give us the ability to store large (and varying) amounts of related data under a single name.

***ADD***

***DELETE***

***GET ITEM #\_\_***

***LENGTH***

# 6 Lists: Example

Let's say that we're writing a shopping cart program and have the following lists:

items	prices	cart
1 Toothpaste	1 2.79	1 Spatula
2 Running Shoes	2 49.99	2 Spatula
3 Mirror	3 129.89	3 Mirror
4 DVD Player	4 49.95	4 DVD Player
5 Spatula	5 8.99	

length: 5      length: 5      length: 4

How would we write a block to **determine the total value of the items in the shopping cart?**

# FINAL CHALLENGE

How would you create the following block?

Your block should create a new list that should be identical to the input list except that all numbers in the list will be unique.
